Amendments to the Specification:

Please replace the paragraph beginning at page 18, line 18 with the following replacement paragraph (addition underlined):

FIG. 5 illustrates a User Interface (UI) for an authoring tool to create production modules 470 as a series of pages 510. A user first specifies page 511 corresponding to a first in a series of effects in a sequence. Button bars 520, 521, 522, 523 are selected to edit pages 510. EDL commands are attached to page 511 by clicking on button bars 520-523 to create script module 480. Bit-mapped still image files are attached to page 511 to form image module 490, and sound effects files are attached to page 511 to make audio module 480. Preview window 530 displays still bitmapped images, and a list of file names for image, audio and script (EDL) files is displayed in preview window 540. Once a bitmapped image, audio file, and edit decision list are associated with page 511, the process is repeated for pages 512, 513, 514, 515, etc. Production module 470 is complete once all of pages 510 are created and assembled. A production editor can then go back and re-edit any of the pages.
